BEA Per Capita Income 2015

April 2016

BEA Per Capita Income

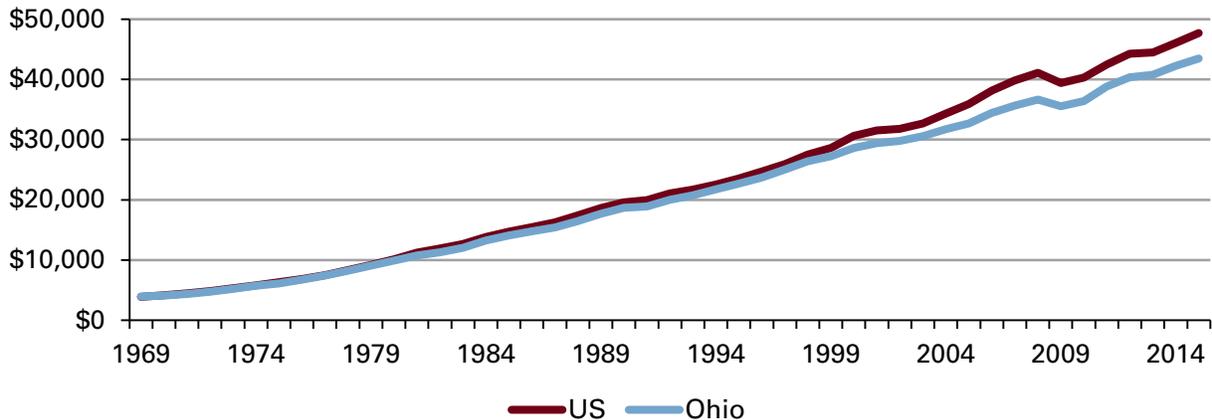

The 2015 per capita personal income for Ohio was \$43,478 (29th in the country). This was an increase of 2.9 percent (37th in the country) from the previous year according to the U.S. Bureau of Economic Analysis. Since 1969, per capita personal income has had annual increases as high as 10.7 percent which occurred during the 1970's and as low as -3.0 percent in 2009. The 2015 total personal income for Ohio was estimated at nearly \$505.0 billion.

Per Capita Personal Income; Historical Trends

In 2015 Ohio's per capita personal income was 91.2 percent of the nation's per capita income. In 1977 Ohio was at nearly 100 percent of the U.S. per capita income. From the early 1980's through 1999, Ohio hovered between 94 and 97 percent of the U.S. figure. From 2000 Ohio's ratio to the national figure trended lower reaching a low of 89.2 percent in 2008. In 2009 the ratio increased to 90.2 percent and the trend has generally continued.

Ohio's Per Capita Personal Income as a Percentage of U.S. Figure

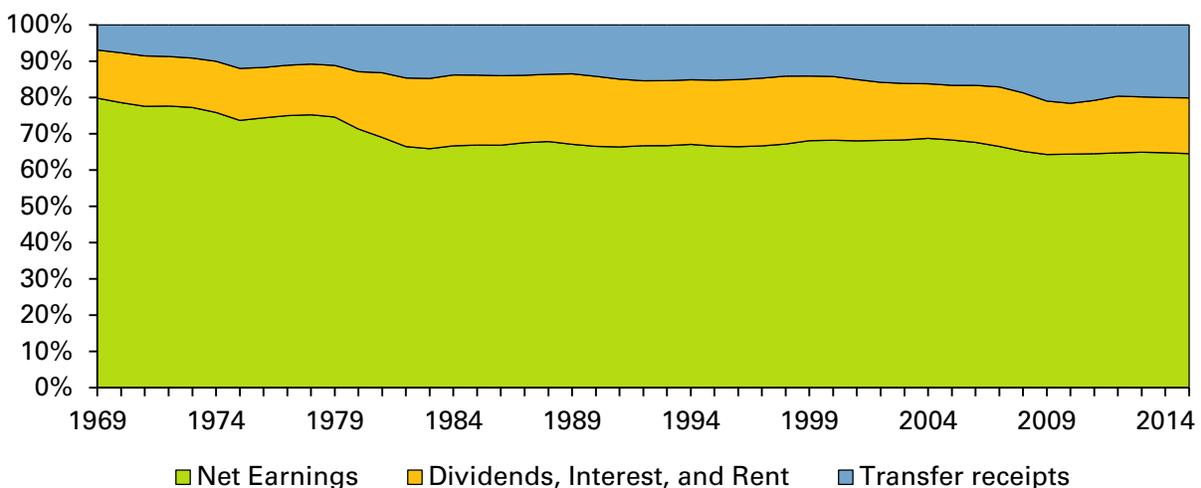

There are three basic components of total personal income; net earnings, dividends and interest, and transfer receipts. While total personal income, as well as per capita personal income, has changed over the years, so has the proportion of the components. For Ohio, the net earnings portion of personal income was 64.5 percent in 2015. Net earnings are essentially wages, salaries, and proprietors' income for residents of an area. In 2015, the proportion for the U.S. was 64.1 percent. In Ohio, the proportion of earnings has remained in the vicinity of 64.6 percent since the Great Recession. In 2010, earnings bottomed out at 64.4 percent.

Components of Personal Income; Selected Years

Type of Income	1970	1980	1990	2000	2009	2010	2011	2012	2013	2014	2015

Ohio's Components of Personal Income

Dividend, interest, and rental income accounted for 15.4 percent of Ohio's personal income in 2015. Dividends are the payments or other assets that come from corporations, interest income may be monetary or imputed, and rental income comes from the rental of real property. In 1989, dividend, interest, and rental income in Ohio approached 20 percent of personal income. This source of income held steady through the 1990's but dropped with the 2001 recession. Dividends, interest and rental income dropped in absolute dollars as well as percentage of personal income through 2004. At the national level, the portion also declined but the decline was not as steep. Starting in 2006, Ohio's dividends, interest, and rental income rebounded slightly but had since dropped with the last recession. For the past four years the proportion has remained near 15.4 percent.

Transfer receipts for Ohio exceeded \$101.5 billion in 2015 and accounted for 20.1 percent of personal income. Transfer receipts are benefits received by persons for which no current services are performed (i.e., federal income transfer program participation). Several of the better known transfer receipts include social security, Medicare, Medicaid, unemployment compensation, food stamps, and Temporary Assistance to Needy Families (TANF). In 1999, a recent low point, transfer receipts accounted for 14.1 percent (\$43.5 billion) of Ohio's total personal income. For the U.S., transfer receipts accounted for 12.8 percent of personal income in 1999 and increased to 17.4 percent in 2015 though it has been as high as 18.7 percent in 2010.

Per capita income is calculated as the income of a given area divided by the resident population of that area. In 2015 Ohio had a total personal income of \$505.0 billion and a population of 11.61 million. This yielded a per capita personal income of \$43,478. The primary source of this measure for the nation, states, and counties is the Bureau of Economic Analysis. It is estimated annually, with counties lagging one year behind the nation and states.

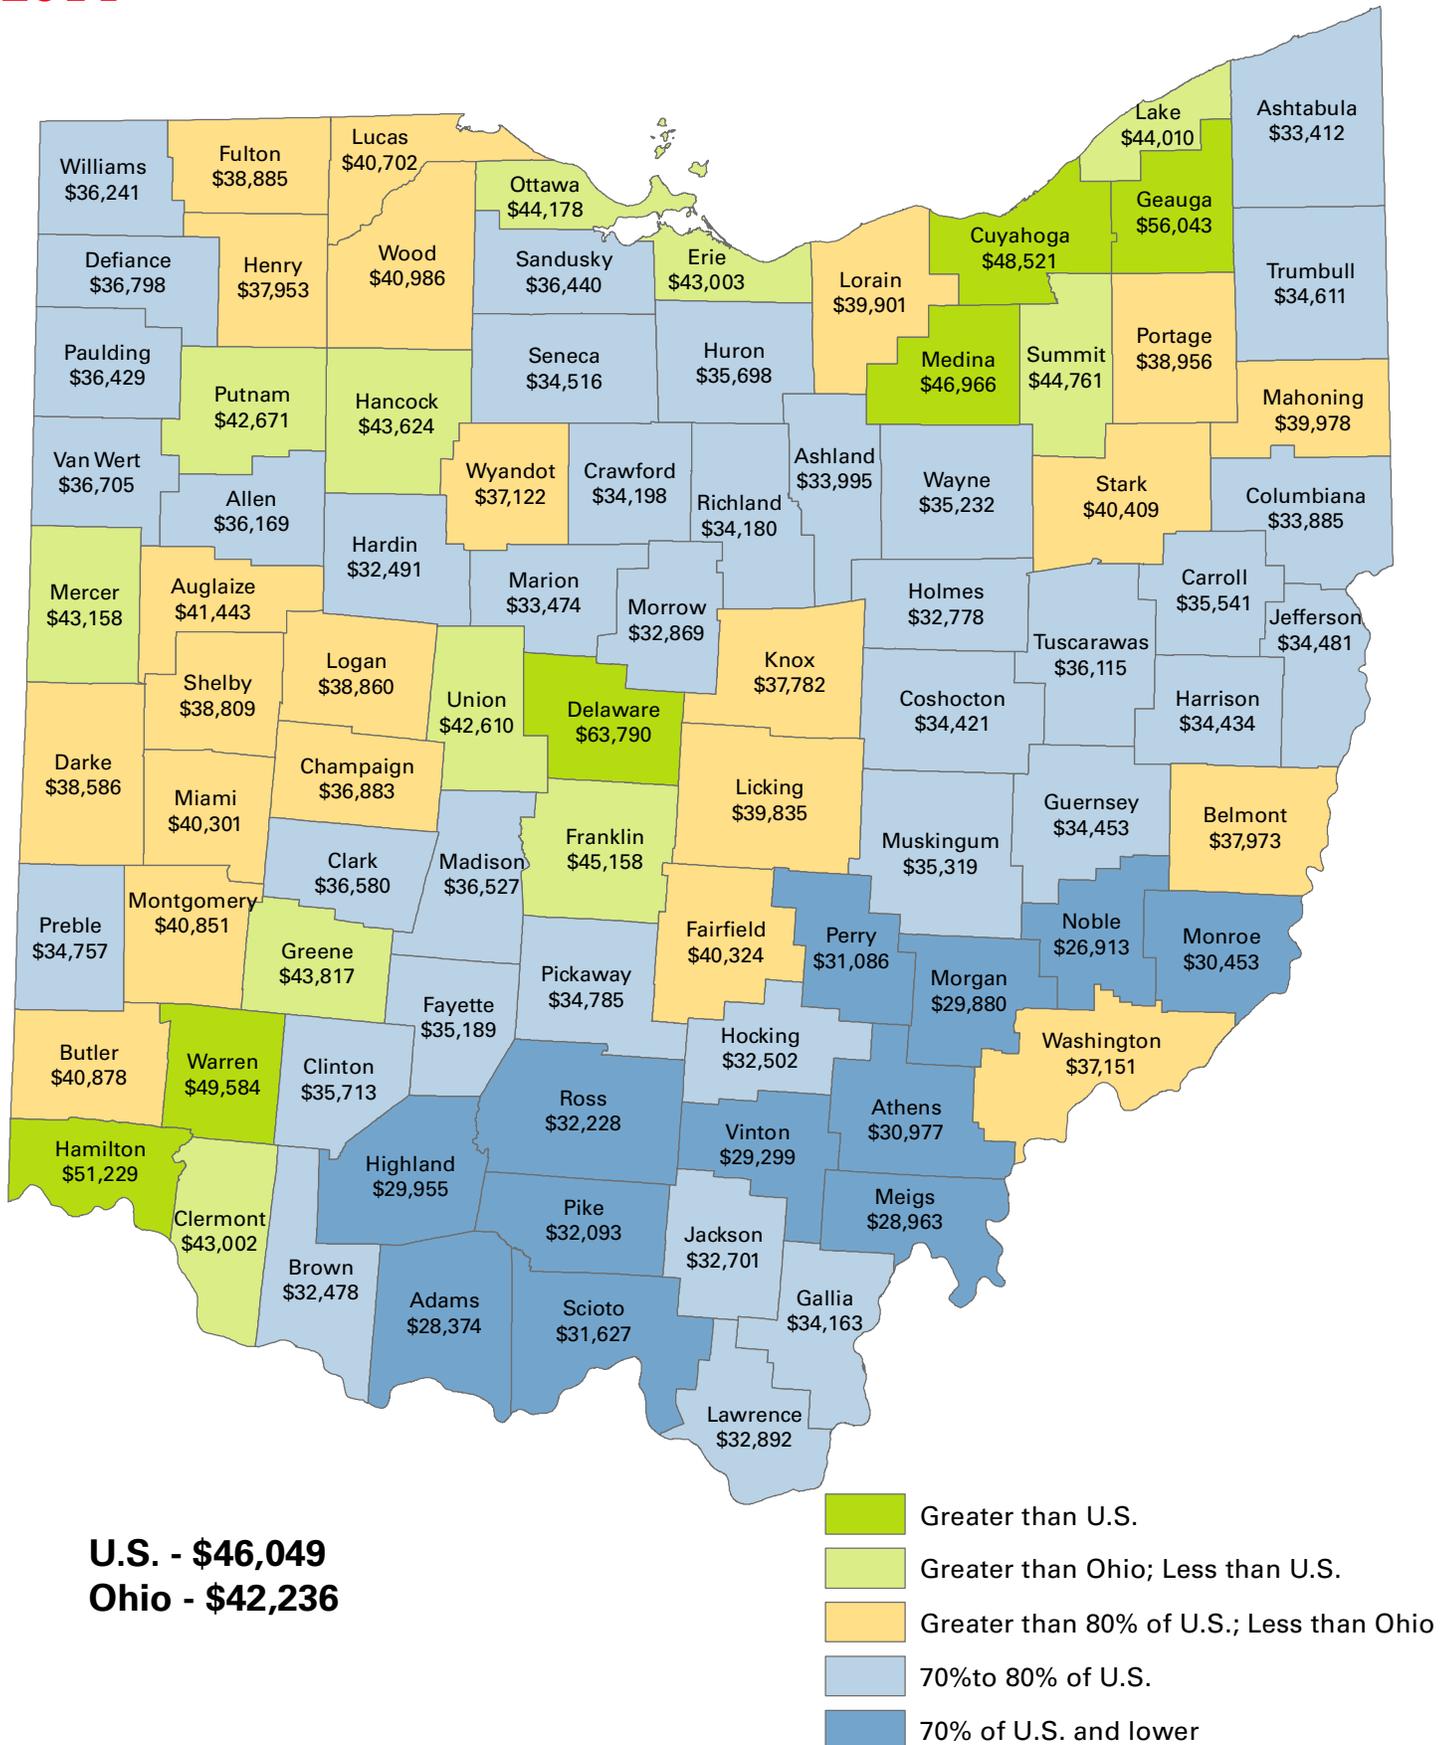

The BEA defines personal income as "the income received by, or on behalf of, all the residents of an area from all sources." It is the sum of wage and salary disbursements, supplements to wages and salaries, proprietors' income, dividends, interest, rent, lump-sum payments, such as insurance payments and inheritances, and personal current transfer receipts. Transfer receipts are benefits received by persons for which no current services are performed. Dividend and interest income for nonprofit institutions that primarily serve individuals is also included. There is also an adjustment for residence. The adjustment is necessary because data for some components are compiled on a place of work basis and there are many people who commute to a job in a state or county different from that in which they reside.

BEA data are mostly gathered from administrative records of businesses and government sources. In some cases the information does not exist in the exact form desired or for the geography of interest. The data are adjusted to compensate for these differences. Also, each year, the three previous years are revised in order to incorporate newly available data. There is no adjustment for inflation with historical data.

The Bureau of Economic Analysis uses the Census Bureau's annual midyear population estimates. Except for college student and other seasonal populations, which are measured as of April 1, the population is estimated as of July 1.

Care should be taken when using county-level per capita personal income. Unusually high or low per capita personal income may be the result of unusual conditions, such as a major construction project or a natural disaster. Counties with a large agricultural sector may display erratic patterns due to multi-year contracts. Also, a large institutional population, such as colleges and prisons, tends to depress per capita income.

Care should be taken when using county-level per capita personal income. Unusually high or low per capita personal income may be the result of unusual conditions, such as a major construction project or a natural disaster. Counties with a large agricultural sector may display erratic patterns due to multi-year contracts. Also, a large institutional population, such as colleges and prisons, tends to depress per capita income.

Care should be taken when using county-level per capita personal income. Unusually high or low per capita personal income may be the result of unusual conditions, such as a major construction project or a natural disaster. Counties with a large agricultural sector may display erratic patterns due to multi-year contracts. Also, a large institutional population, such as colleges and prisons, tends to depress per capita income.

Care should be taken when using county-level per capita personal income. Unusually high or low per capita personal income may be the result of unusual conditions, such as a major construction project or a natural disaster. Counties with a large agricultural sector may display erratic patterns due to multi-year contracts. Also, a large institutional population, such as colleges and prisons, tends to depress per capita income.

Care should be taken when using county-level per capita personal income. Unusually high or low per capita personal income may be the result of unusual conditions, such as a major construction project or a natural disaster. Counties with a large agricultural sector may display erratic patterns due to multi-year contracts. Also, a large institutional population, such as colleges and prisons, tends to depress per capita income.

Care should be taken when using county-level per capita personal income. Unusually high or low per capita personal income may be the result of unusual conditions, such as a major construction project or a natural disaster. Counties with a large agricultural sector may display erratic patterns due to multi-year contracts. Also, a large institutional population, such as colleges and prisons, tends to depress per capita income.

Care should be taken when using county-level per capita personal income. Unusually high or low per capita personal income may be the result of unusual conditions, such as a major construction project or a natural disaster. Counties with a large agricultural sector may display erratic patterns due to multi-year contracts. Also, a large institutional population, such as colleges and prisons, tends to depress per capita income.

Care should be taken when using county-level per capita personal income. Unusually high or low per capita personal income may be the result of unusual conditions, such as a major construction project or a natural disaster. Counties with a large agricultural sector may display erratic patterns due to multi-year contracts. Also, a large institutional population, such as colleges and prisons, tends to depress per capita income.

Care should be taken when using county-level per capita personal income. Unusually high or low per capita personal income may be the result of unusual conditions, such as a major construction project or a natural disaster. Counties with a large agricultural sector may display erratic patterns due to multi-year contracts. Also, a large institutional population, such as colleges and prisons, tends to depress per capita income.

Care should be taken when using county-level per capita personal income. Unusually high or low per capita personal income may be the result of unusual conditions, such as a major construction project or a natural disaster. Counties with a large agricultural sector may display erratic patterns due to multi-year contracts. Also, a large institutional population, such as colleges and prisons, tends to depress per capita income.

Care should be taken when using county-level per capita personal income. Unusually high or low per capita personal income may be the result of unusual conditions, such as a major construction project or a natural disaster. Counties with a large agricultural sector may display erratic patterns due to multi-year contracts. Also, a large institutional population, such as colleges and prisons, tends to depress per capita income.

Care should be taken when using county-level per capita personal income. Unusually high or low per capita personal income may be the result of unusual conditions, such as a major construction project or a natural disaster. Counties with a large agricultural sector may display erratic patterns due to multi-year contracts. Also, a large institutional population, such as colleges and prisons, tends to depress per capita income.

Care should be taken when using county-level per capita personal income. Unusually high or low per capita personal income may be the result of unusual conditions, such as a major construction project or a natural disaster. Counties with a large agricultural sector may display erratic patterns due to multi-year contracts. Also, a large institutional population, such as colleges and prisons, tends to depress per capita income.

Care should be taken when using county-level per capita personal income. Unusually high or low per capita personal income may be the result of unusual conditions, such as a major construction project or a natural disaster. Counties with a large agricultural sector may display erratic patterns due to multi-year contracts. Also, a large institutional population, such as colleges and prisons, tends to depress per capita income.
